# ABOUT

Printer facilitates project creation, allowing our community to get in early, build, and profit from newly created projects.

Think of Printer as owning shares in a vast investment portfolio. Imagine profiting not just from the price of Printer itself, but on all future projects that stem from its ecosystem. At Printer, we generate new projects and our investors always come first.

*"Own \$PRTR. Always be early"*

If you own Printer, you're part of the team. You reap the same benefits as the creators. And unlike any other token out there, Printer allows you to always get in early on EVERY new opportunity.

All proceeds from activities (i.e. launching projects, staking, investing income) all funnel back to the Printer token, either through buybacks or payouts to holders. This is on top of holders receiving new project tokens when they launch through the ecosystem.

# PRINTER TOKEN – PRTR

Printer (PRTR) is the central token of the project generating ecosystem and the grease providing a smooth-running ecosystem and plays a role in many projects. For example, Printer holdings will determine participation on the launchpad. All DeFi projects involving farming/staking will give PRTR holders the opportunity to use the tokens they hold.

As the use cases grow the demand for holding PRTR tokens will grow organically. This, given PRTR is a fixed supply token, implies it becoming more valuable over time. It also means that by holding PRTR tokens you are not betting on one horse, but on a number of future horses.

The Printer ecosystem will continue generating new exciting projects without the need for investors to research, monitor and track each and every new project or undertake cumbersome airdrop registrations or to buy in again and again. New developments can be picked up and added: simple, plug-and-play.

# TOKENOMICS

PRTR is a fixed supply token; there will never be any more created. This way it is easily comparable to a share in a company in the traditional sense. Which is exactly what we want people to feel like: shareholders in a company. We build the company we would love to invest in ourselves, so you can as well.

*Initial circulating supply: 100,000,000*  
*Total supply: 1,000,000,000*

# NEW TOKEN RIGHTS

The base of the Printer ecosystem and the reason Printer holders are truly equal to each other (also to the team / founders). Printer holders are given their share of all projects launched through the Printer ecosystem.

Holders of PRTR get a pro-rata distribution of new Printer ecosystem projects. Although it sounds simple this is actually a much better solution than combining projects under the flag of one token.

Since the new tokens are given for free there is no difference in cost basis between a PRTR holder receiving this new issue and a team member of the new project token. The cost basis is 0 for all of them. Obviously there are investments in terms of time and effort by the team, but the cost basis in terms of initial investment is 0 for all.

Printer holders are thus 'investing' on the same level, and with the same profit potential, as project development team members. They are also have a vested interest in making these new tokens a success and, in combination with Printer's marketing team and the CBIP, will in all likelihood spread the word on these projects

# GOVERNANCE

As mentioned above, holding PRTR is akin to holding a share of a company. It can't be diluted, any token has as much claim to proceeds and a vote that counts just as much as any other token. Printer holders get a voice in the future and direction of the ecosystem.

The initial direction and goals as described in the roadmap, amongst others, are set by Printer's founding team. Since this is not initially up for a vote the project is not fully guided by a community. As time passes, more and more tokens will be distributed and the future projects and strategies for the ecosystem will be often determined by a vote, but this is still in the future and not the present.

Our goal is to give Printer a solid foundation with a large 'core team' complemented by holders via the CBIS and long time token holders. A voting mechanism for giving actual governance functions to all holders will be implemented. In time there is room for Printer to evolve into a DAO should the community wish so.

# PROJECT GENERATOR

Printer supports a dedicated development team focused on building new projects for the Printer ecosystem. Fuelled by PRTR token, our project generator grants holders access to early stage opportunities via a selection process based on voting. Projects will be built via our in-house development team to enable the IDO process.

Additionally, PRTR owners will receive distributions from each new project's token supply. With all projects sharing a percentage of their total token supply to Printer holders, the whole ecosystem is geared towards making Printer more valuable, creating a reliable investment platform for our holders.

# LAUNCH DAPP

The Launch Dapp is where In-house or outside development teams can launch their projects. Any project wanting to launch will be vetted by the Printer team, then it will go to the community for voting.

- IDO's will be completely without whitelists, ensuring every PRTR holder can participate in every offering.
- A lottery system ensures equal opportunity to participate in the sale.
- No first-come-first-served, but a time slot system, making the whole experience stress-free.

- Auto-participating feature. Sign up automatically with previously-staked tokens for all projects going live on the launchpad.
- To participate in the launch Dapp, we ask that participants are Printer token holders.

# PORTFOLIO PROJECTS

*(All names are placeholders – all Printer projects will be stand-alone projects with dedicated teams).*

## PRINTER FUNDS

Printer Funds is a hedge fund and money manager. Staking pools will allow users to lock their chosen funds over a period of time. The locked funds are used by the fund management team to generate outstanding returns with risk profiles and strategies typically not within reach of ordinary investors. Strategies one can think of are regular arbitrage, statarb, relative value, but also more exotic investment strategies and early access to promising projects will be run through the fund.

As the project evolves, further developments will include staking pools with dedicated strategies, so users can choose their own preferred risk/return profiles. Also, one of our main points of attention will be getting a set-up compliant for institutional investment on-chain (non-existent at this point in time).

Token utility will be based on 2 features:

- 50% of the funds' performance fees are allocated to token holders (revenue share).
- When Funds moves to the phase where strategies are split across multiple staking pools, Funds native token holdings will determine access to these various pools.

## PRINTER POOLS

Pools is a purely single-sided staking platform. The chief aim of Pools is to make it the premier destination crypto holders think about when they have tokens sitting idle in their wallets. The staking platform will strive to provide the best possible yields for investors on their crypto. This yield optimization will use a self-balancing mechanism to allow for yields to change based on the platform's need for one cryptocurrency over the other, resolving supply/demand issues.

## PRINTER STABLECOIN BANK

Just as a traditional bank account is the home of your fiat, StableCoin Bank provides a home to a variety of stable coins. By locking them up in staking pools competitive yields are generated, in essence functioning similarly to how a regular bank account works. The long term goal of this project is to allow for users with enough StableCoin Bank native token holdings and regular Printer token holdings to be able to order a credit card so they can use their stablecoins for real world transactions.

# COMMUNITY BUILDER INCENTIVE PROGRAM

Our team is set up so that it can expand as the project grows. We have kicked-off with the central group that envisioned and developed Printer, but there is plenty of room for others to join as we grow. With this in mind our team's token distribution scheme is set up from the start.

When it comes to growing the core team, there are direct project roles, such as developers and graphic designers, but since we are focused on solidifying Printer with a strong community we have reserved a significant part of our tokens for community builders. For this a Community Builder Incentive Program (CBIP) has been established.

Anyone can gain access to the CBIP, if you are a developer, graphic designer, marketer, YouTuber/influencer, etc; or believe you can positively contribute to the Printer community in any way whatsoever, apply to become a part of the team through the CBIP! All team member are locked in on a linear vesting schedule and the same will hold for members coming onboard through the CBIP.

From our TGE onward and running for 10 months, 1% of all tokens will be unlocked monthly and distributed amongst the actively contributing team members. New team members, such as those that join via the CBIP, will join this vesting schedule. This way it is in everyone's interest to keep contributing and building out Printer to receive distributions during future allocation events.

# BUYBACK WAR CHEST

## *"A safety net designed to bring stability"*

The biggest driving force behind the stability of the PRTR token and the safety net for holders is the Buyback War Chest. A portion of proceeds from all activities including pre-launch sales, commissions on Printer DeFi solutions and more, will go to the War Chest in order to make sure the token realizes its long term potential.

The buyback mechanism ensures that during times where severe negative price momentum (dips) occur there will be direct buybacks initiated from the War Chest. Besides adding demand to provide a positive impact to price action the buybacks further reward long time holders.

An initial significant amount of Printer's supply, 10%, is earmarked for the War Chest.

This amount can be initiated as liquidity or through strategic operations used to fill the War Chest with funds for buybacks.

Through our rules-based buyback process the War Chest can only grow as a percentage of total supply. This means Printer will be gradually bought back and become more scarce.

Buybacks will follow a rule-based system, the actual

# ROADMAP

## *PHASE 1*

- First Audit
- CBIP Start / Team Expansion
- Launch Dapp
- First CEX listing
- Project 'Printer Funds'
- Launch on 2 chains

## *PHASE 2*

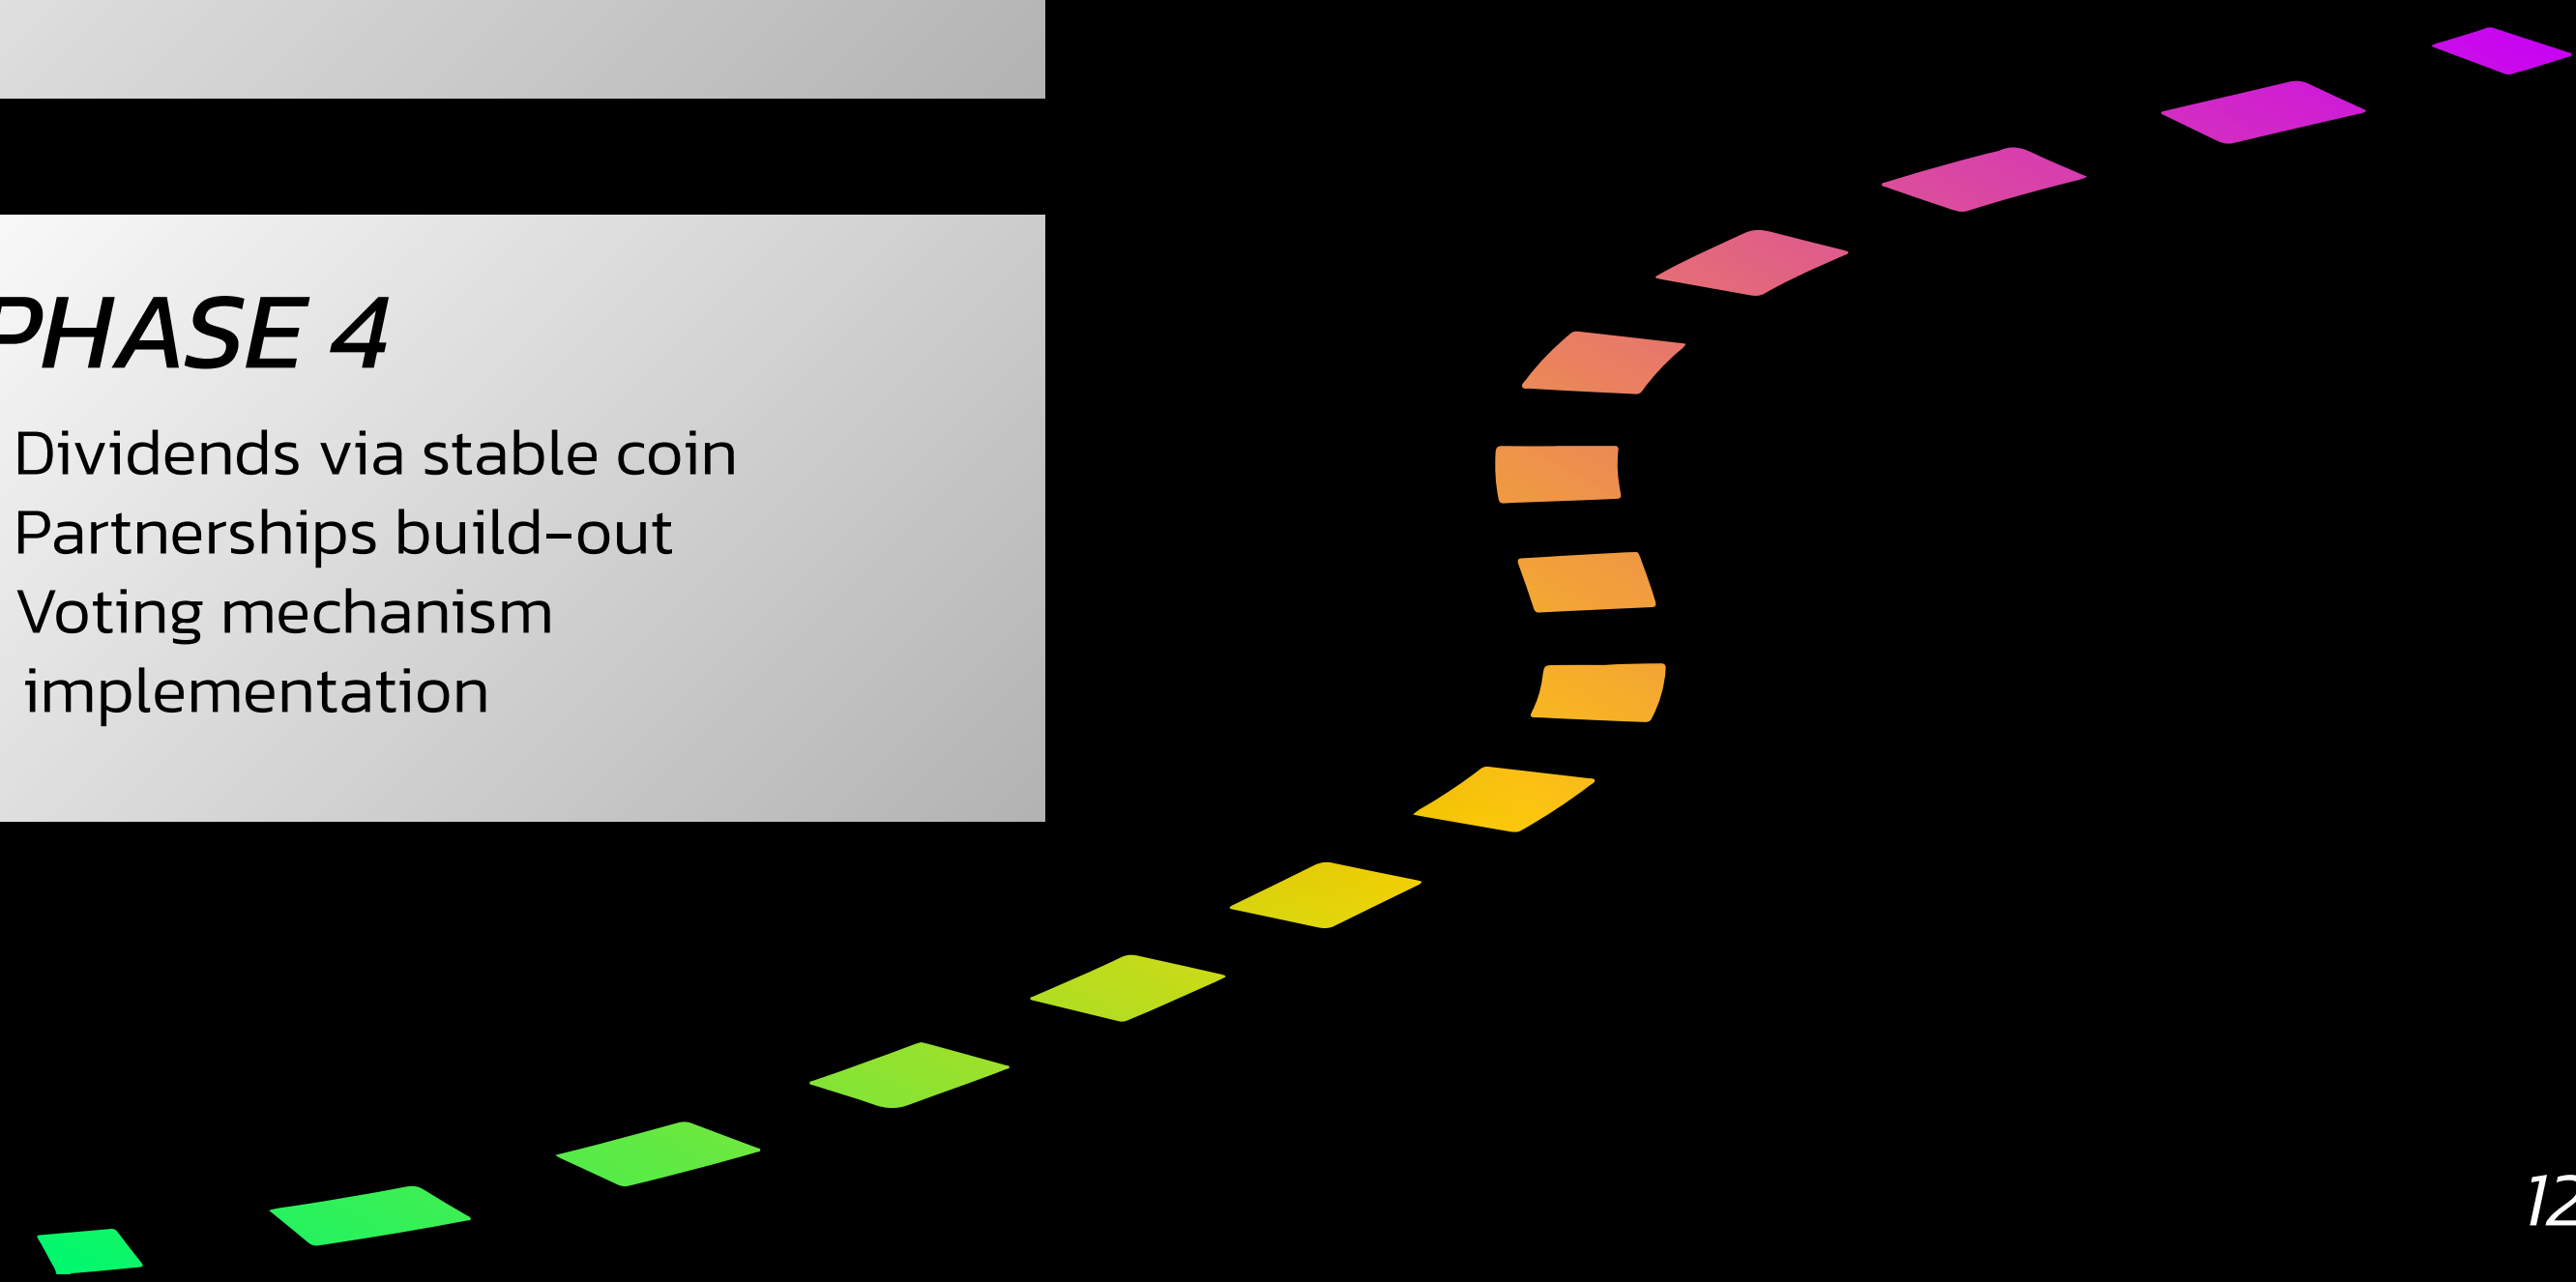

- Bridge
- Partnerships
- Project 'Printer Pools'
- Second Audit
- Marketing / CBIP Push

## *PHASE 3*

- First outside project(s)
- First community project(s)
- New CEX listing
- Project 'Printer StableCoin Bank'

## *PHASE 4*

- Dividends via stable coin
- Partnerships build-out
- Voting mechanism implementation

# ABOUT THE TEAM

The team comes from a diverse background, including development, hedge funds, high-frequency traders, and marketing.

Printer was conceptualized and built by a distributed pseudo-anonymous team.
